

AI-Assisted Website Development

Creative direction, rapid prototyping, generative content, and web execution

This portfolio presents five websites developed through a hybrid workflow: senior creative direction, AI-assisted coding, generative AI content development, UX strategy, and fast deployment. The objective was not to make generic websites faster, but to create sharper positioning, stronger visual worlds, and more useful business communication with leaner production cycles.

Selected projects

Evil Creatives - Creative studio / portfolio / case-study platform

CC Explorations - Satellite mineral exploration / deep-tech corporate website

Copper Nano - Industrial product website / technical sales landing page

QuickTime - Retail fuel / convenience brand website

Encore Family Entertainment - Entertainment destination / investor-facing concept website

Methodology

A hybrid production system combining AI speed with human judgment. AI accelerates exploration and execution; creative direction defines what should exist, why it matters, and how it should communicate.

AI-assisted coding

Rapid interface development, component iteration, responsive layout, deployment support, and faster prototyping cycles.

Generative content

Copy exploration, message hierarchy, headline testing, visual concept development, and category-specific storytelling.

Human creative direction

Positioning, tone, structure, taste, editing, client logic, and final decision-making remain intentionally human.

Lean production

Small-team execution with the speed of AI tools and the judgment of senior creative/product experience.

Result A faster path from idea to launch: clearer positioning, stronger visuals, better content structure, and working websites that support sales, investor conversations, and client acquisition.

Evil Creatives

www.evilcreatives.com

PROJECT 01

GOAL

Create a distinctive agency website that communicates creative authority, personality, and proof of work without looking like a generic template. The site had to feel like a brand world: bold, visual, direct, and immediately recognizable.

APPROACH

The work combines AI-assisted frontend development with strong human creative direction. The interface uses aggressive scale, high-contrast typography, theatrical navigation, and a graphic language closer to entertainment branding than corporate marketing. Generative AI supported visual exploration, copy iteration, and fast prototyping, but the structure remains driven by positioning, case studies, and client trust.

STYLE

Raw, cinematic, anti-corporate, high-impact, intentionally confrontational. The visual system is built around oversized type, graphic tension, and a strong editorial rhythm.

ACHIEVEMENT

Turned the website into a brand statement rather than a brochure. It positions Evil Creatives as a creative partner with a point of view, while still giving users clear access to testimonials, case studies, and contact pathways.

What AI contributed

AI supported faster coding, structural iteration, content development, headline exploration, and visual concept testing. The strategic direction, editing, design judgment, and final positioning were controlled by human creative direction.

CC Explorations

www.ccexplorations.com

PROJECT 02

SATELLITE MINERAL EXPLORATION / DEEP-TECH CORPORATE WEBSITE

GOAL

Translate a complex technical service - satellite-based mineral and resource exploration - into a clear, credible, investor- and client-facing digital presence. The site needed to explain advanced technology without losing immediacy or commercial focus.

APPROACH

AI-assisted coding accelerated layout development, while generative AI supported the visual concept of exploration from space. The content architecture was designed to move from a big promise to concrete use cases: minerals, energy resources, groundwater, and archaeological targets. The messaging balances scientific ambition with practical business benefits: faster target identification, lower cost, reduced environmental impact, and lower drilling risk.

STYLE

Scientific, cinematic, futuristic, and field-oriented. The satellite beam, night landscape, and exploration crew create a bridge between advanced physics and real-world operations.

ACHIEVEMENT

Created a high-level corporate narrative that makes a technical exploration platform understandable, memorable, and commercially legible for potential partners, investors, and exploration teams.

What AI contributed

AI supported faster coding, structural iteration, content development, headline exploration, and visual concept testing. The strategic direction, editing, design judgment, and final positioning were controlled by human creative direction.

Copper Nano

www.coopernano.com

PROJECT 03

INDUSTRIAL PRODUCT WEBSITE / TECHNICAL SALES LANDING PAGE

GOAL

Present copper nanoparticles as a serious industrial product while making the offer immediately readable for buyers, partners, and technical evaluators. The page had to communicate purity, particle size, applications, and credibility at first glance.

APPROACH

The site uses AI-assisted development and generative content workflows to combine technical data with a strong product-marketing structure. The design foregrounds the key proof points - 99.999% purity, 50-400 nm particles, surface area, CAS number, and lab verification - while guiding users toward sample requests and specifications. The SEM image is treated as evidence, not decoration.

STYLE

Technical, premium, industrial, and data-forward. The warm copper palette, molecular network background, and lab-report treatment connect material science with commercial clarity.

ACHIEVEMENT

Built a focused product landing page that turns a specialized scientific material into a marketable digital offer, with strong calls to action and clear technical credibility.

What AI contributed

AI supported faster coding, structural iteration, content development, headline exploration, and visual concept testing. The strategic direction, editing, design judgment, and final positioning were controlled by human creative direction.

QuickTime

www.quicktime.com

PROJECT 04

RETAIL FUEL / CONVENIENCE BRAND WEBSITE

GOAL

Develop an investor- and public-facing website for a modern convenience-store and fuel concept. The goal was to make the brand feel cleaner, more current, and more community-oriented than the typical gas-station category.

APPROACH

AI-assisted workflows helped accelerate brand positioning, page structure, and visual direction. The messaging reframes fuel and convenience retail around neighborhood improvement, cleaner design, better living, and modern mobility. The site is simple by design: a clear hero, direct navigation, and a concise story aimed at investors, sellers, and future customers.

STYLE

Clean, optimistic, accessible, and retail-friendly. Green is used as a signal of freshness, sustainability, and convenience, while the large-scale storefront image grounds the concept in a real-world environment.

ACHIEVEMENT

Created a straightforward digital presence that makes the business feel investable, approachable, and operationally real, while supporting future expansion and stakeholder conversations.

What AI contributed

AI supported faster coding, structural iteration, content development, headline exploration, and visual concept testing. The strategic direction, editing, design judgment, and final positioning were controlled by human creative direction.

Encore Family Entertainment

<https://encorefamilyentertainment.com>

PROJECT 05

ENTERTAINMENT DESTINATION / INVESTOR-FACING CONCEPT WEBSITE

GOAL

Communicate the ambition of a next-generation immersive destination attraction. The website needed to feel large-scale, imaginative, and investor-ready while still remaining clear enough for business development conversations.

APPROACH

Generative AI was used to support visual worldbuilding, atmosphere, and concept imagery, while AI-assisted coding accelerated the site build. The structure focuses on the core business narrative: what the destination is, why it matters, the attraction concept, investor materials, and leadership. The design makes the brand feel like an entertainment property, not a standard corporate deck.

STYLE

Epic, cinematic, family-oriented, and adventure-driven. The visual language uses scale, fantasy landscapes, and bold brand presence to create emotional momentum around the destination concept.

ACHIEVEMENT

Produced an investor-facing web presence capable of supporting early conversations, communicating vision, and giving the project a tangible digital identity before full physical development.

What AI contributed

AI supported faster coding, structural iteration, content development, headline exploration, and visual concept testing. The strategic direction, editing, design judgment, and final positioning were controlled by human creative direction.

Capability Summary

This body of work demonstrates a practical AI web-production model: using AI to accelerate code, visual exploration, content generation, and iteration while maintaining strong creative direction and business clarity. The result is not generic automation, but faster production of websites that can explain complex offers, support investor conversations, position brands, and turn early-stage ideas into credible digital presences.

Core services demonstrated

- AI-assisted website development
- Creative direction and visual positioning
- Startup and investor-facing storytelling
- Rapid prototyping and Vercel deployment
- Generative AI content workflows
- UX and information architecture
- Technical product communication
- Brand narrative and conversion-focused messaging

AI tools accelerate production. The value is the combination of taste, strategy, execution, and judgment.
