

EVIL CREATIVES

AI PRODUCTS NARRATIVE SYSTEMS INTELLIGENT EXPERIENCES

A capability portfolio for clients who need more than AI demos: strategy, product design, domain intelligence, interface execution and deployable systems.

Methodology

A product development model combining AI speed with human judgment.

AI accelerates exploration and execution. Creative direction defines what should exist, why it matters, and how it should communicate. The result is not generic automation, but domain-specific products designed around users, workflows and business value.

Product Strategy

Define the opportunity, the audience, the workflow and the commercial value before selecting the model.

AI Architecture

Build intelligence around context: data, rules, constraints, domain logic and usable outputs.

Experience Design

Turn complex AI workflows into interfaces people can understand, trust and use.

Rapid Execution

Prototype, test, iterate and deploy with a small team and production-aware tools.

Result A faster path from idea to working product: clearer positioning, stronger interfaces, more useful AI behavior and deployable systems that support sales, research, operations and entertainment.

Product Families

A repeatable system for turning client problems into intelligent products.

Screenshots are proof points. The offer is a repeatable capability: define the opportunity, design the system, orchestrate the AI, and ship the product.

MATCHPOINT

AI Tennis Training Platform

PROJECT 01

VERTICAL AI / SPORTS COACHING PLATFORM

GOAL

Create a domain-specific coaching system capable of translating tennis methodology into structured player development.

APPROACH

Training plans, session tracking, video analysis, lesson recommendations and goal progression live inside one player development environment.

STYLE

Clean, athletic, disciplined and performance-oriented. The interface feels closer to a training dashboard than a generic AI chat tool.

ACHIEVEMENT

Demonstrates how AI becomes valuable when it understands a discipline, not when it simply answers questions.

What AI contributed

AI supported product structure, rapid interface development, content logic, model workflow design and iteration. Human creative direction defined the positioning, user value, information architecture, taste and final product logic.

STORYLINE

Narrative Intelligence Platform

PROJECT 02

ARCHIVES / LETTERS / CANON MANAGEMENT / AUTHORSHIP

GOAL

Transform fragmented archives into coherent stories.

APPROACH

STORYLINE is built for authors, historians, researchers, museums and documentary teams working with letters, diaries, notes, interviews and historical material.

STYLE

Editorial, archival and research-driven. The product treats writing as reconstruction, not automation.

ACHIEVEMENT

Turns scattered documents into timelines, relationships, contradictions, themes and narrative structures - a canon system for reality.

What AI contributed

AI supported product structure, rapid interface development, content logic, model workflow design and iteration. Human creative direction defined the positioning, user value, information architecture, taste and final product logic.

CC GEOTARGET

Geospatial Intake Platform

PROJECT 03

SURVEY AREA
0.00 km² 0 pts

Remove Last Point Clear All Points

Search location

Add Points Manually Upload Geospatial File

exploration intake summary.

Full name

Email

Company name

Survey category
Mineral exploration

Budget range
Below \$25,000

Timeline / urgency
Immediate (0-2 weeks)

Project notes

Submit survey request

AOI DEFINITION / KMZ GENERATION / SURVEY QUALIFICATION

GOAL

Reduce friction between survey inquiry and technical evaluation.

APPROACH

The client defines an area of interest, selects survey needs, uploads geospatial data and produces a structured request that can be qualified by AI.

STYLE

Operational, scientific and clear. It makes a complex technical sales process feel simple and credible.

ACHIEVEMENT

Turns geospatial lead qualification into an interactive product instead of an email chain.

What AI contributed

AI supported product structure, rapid interface development, content logic, model workflow design and iteration. Human creative direction defined the positioning, user value, information architecture, taste and final product logic.

GEO-APP

AI Geospatial Intelligence

PROJECT 04

3D DATA VISUALIZATION / ANOMALY INTERPRETATION / DECISION SUPPORT

GOAL

Transform raw exploration datasets into interpretable intelligence.

APPROACH

GEO-APP combines 3D visualization, resource overlays, anomaly interpretation and AI-assisted analysis inside an interactive Cesium environment.

STYLE

Technical, cinematic and data-driven. The system makes scientific complexity visually inspectable.

ACHIEVEMENT

Reduces the distance between data acquisition and actionable exploration decisions.

What AI contributed

AI supported product structure, rapid interface development, content logic, model workflow design and iteration. Human creative direction defined the positioning, user value, information architecture, taste and final product logic.

CHESS MASTER

AI Tutoring Prototype

PROJECT 05

GOAL

Explore how AI can act as a strategic tutor inside an interactive game environment.

APPROACH

Gameplay, move history, captured pieces and AI advice are integrated into one learning flow.

STYLE

Simple, legible and instructional. The interface is designed for clarity rather than spectacle.

ACHIEVEMENT

Shows how AI tutoring can be embedded directly into practice, not separated into a help window.

What AI contributed

AI supported product structure, rapid interface development, content logic, model workflow design and iteration. Human creative direction defined the positioning, user value, information architecture, taste and final product logic.

LUMEN

World Activation Engine

PROJECT 06

GOAL

Turn attractions into media ecosystems.

APPROACH

Organizations upload the world. LUMEN understands the world, activates visitors through personalized media and extends the experience beyond the exit.

STYLE

Premium, cinematic and entertainment-driven. The product should feel like a portal into a brand world, not an admin tool.

ACHIEVEMENT

Creates a new layer of engagement and monetization for parks, museums, cruises, live events and cultural destinations.

What AI contributed

AI supported product structure, rapid interface development, content logic, model workflow design and iteration. Human creative direction defined the positioning, user value, information architecture, taste and final product logic.

LUMEN System

From visitor moment to persistent media ecosystem.

PROJECT 06

01 Upload the World

Websites, brochures, handbooks, maps, rules and source material become structured context.

02 Understand the World

The system builds usable knowledge: characters, places, tone, categories, constraints and experience logic.

03 Activate Visitors

Guests create personalized videos, posters, images and merchandise from their real visit.

04 Extend Engagement

The park relationship continues after exit through shareable media and recurring content.

What AI contributed

AI supports world ingestion, category extraction, prompt orchestration, image/video generation and content personalization. The value is the product system: connecting physical experiences, guest identity, world logic and post-visit engagement.

Capability Summary

What this body of work proves.

This portfolio demonstrates a practical AI product-development model: using AI to accelerate coding, data interpretation, visual exploration, content generation and workflow design while keeping the critical decisions human: strategy, taste, structure, positioning and business logic.

AI Product Design

From opportunity definition to functional prototype.

Domain Intelligence

AI systems shaped around a specific discipline or market.

Narrative Systems

Canon, archives, timelines, character logic and authorship support.

Geospatial Intelligence

Maps, 3D environments, survey workflows and analytical interfaces.

Experience Platforms

Visitor activation, persistent engagement and new monetization layers.

Rapid Prototyping

Lean production from concept to deployed application.

We do not build prompts. We build products.
